

Master Prompt

We are designing the operating system for software architecture.

Blueprint should feel like the first time someone opened Arc Browser, Linear, or Apple's VisionOS—not because it copies them, but because it feels fundamentally different from every admin dashboard on the internet.

The user should immediately think:

"What the fuck is this? I want to play with it."

This interface should have cinematic depth, spatial hierarchy, layered motion and premium interaction design.

DO NOT DESIGN A DASHBOARD.

Instead, design an engineering workspace.

The repository is the hero.

Everything revolves around it.

Design principles:

- Apple's Liquid Glass (WWDC25)
- Arc Browser
- Raycast

- Nothing OS
- Linear
- Framer
- Figma
- Vercel Motion
- Experimental portfolio websites

Avoid:

- Tailwind dashboard templates
- KPI cards
- Analytics layout
- Bootstrap spacing
- Admin panel aesthetics
- Generic glassmorphism

Instead:

- Liquid materials
- Floating layers
- Magnetic hover interactions
- Glass refraction
- Dynamic shadows
- Bloom
- Ambient lighting
- Edge highlights
- Volumetric depth
- Large typography

- Massive whitespace
- Editorial layouts

Everything should exist on different Z layers.

Foreground

Repository

Midground

Workspace

Background

Animated architecture

Far background

Particles / gradients / light

Nothing should feel flat.

Cards should overlap.

Panels should float.

Elements should cast soft depth.

Mouse movement should subtly shift perspective.

The UI should feel alive.

Every interaction should have purpose.

Every hover should feel magnetic.

Every transition should feel cinematic.

Animations should use Framer Motion heavily.

Use:

layout animations

shared layout transitions

AnimatePresence

springs

parallax

3D transforms

cursor-aware lighting

smooth interpolation

Do not animate for decoration.

Animate to create physicality.

The workspace should resemble an engineering notebook floating in space rather than a website.

The repository should become the visual centerpiece.

Remove vanity metrics.

Replace them with meaningful engineering information.

Insights

show:

Repository Intelligence

Everything should communicate understanding rather than analytics.

The UI should feel expensive.

Every pixel should look intentional.

If this looked like a \$300M startup product, we succeeded.

Motion Prompt

Do not use simple fade-ins.

Every animation should create spatial awareness.

Use:

- z-axis transforms
- subtle rotateX
- rotateY
- perspective
- layered parallax
- spring physics
- magnetic cursor effects
- liquid hover transitions
- delayed children
- staggered reveals
- shared layout animations
- morphing backgrounds

Panels should feel like physical objects.

The cursor should feel like it affects the interface.

Nothing should snap instantly.

Everything should glide.

Hero Prompt

The landing section should not feel like a hero.

It should feel like entering Blueprint.

The repository should already be alive.

Knowledge graph nodes slowly orbit.

Architecture connections pulse.

Soft particles float.

Ambient lighting follows cursor.

Repository cards gently hover in 3D.

Background gradients slowly evolve.

Everything feels active even before interaction.

Layout Prompt

Think less "dashboard".

Think more "mission control".

Large empty space is intentional.

The interface breathes.

The repository dominates the experience.

Every section feels like a room inside the workspace.

Scrolling should reveal new layers instead of new cards.

Avoid grids whenever possible.

Build compositions.

Interaction Prompt

Every hover should feel satisfying.

Buttons compress slightly.

Panels tilt.

Lighting shifts.

Borders glow softly.

Icons animate.

Navigation morphs.

Repository cards react to cursor position.

Nothing should feel static.
